

Task - 3 : Relational & Unary Operators

Relational Operators :

- Create one Java project in Eclipse.
- Create 2 int type variables
- Perform all relational operations (== , > , < , >= , <= , !=)
- Don't print the values directly.
 - **Ex : System.out.println(a==b); XXXX**
- Store the value into a variable and print that variable.

Unary operators :

- Create one Java project in Eclipse.
- Create 2 short type variables(one positive and one negative number) and one boolean variable.
- Perform + operation on positive variable and print it.
- Perform - operation on negative variable and print it.
- Perform ! operation on boolean variable and print it.
- Perform post increment and pre increment operations and print them.
- Perform post decrement and pre decrement operations and print them.
